                                          plasminogen to form plasmin.
SUBUNIT: FOUND IN HIGH AND LOW MOLECULAR MASS FORMS. BACH
CONSISTS OF TWO CHAINS, A AND B. THE HIGH MOLECULAR MASS FORM
CONTAINS A LONG CHAIN A. CLEAVAGE OCCURS AFFER RESIDUE 156 IN THE
LOW MOLECULAR MASS FORM TO YIELD A SHORT AI CHAIN (BY SIMILARITY)
SIMILARITY: BELONGS TO PERPITABRE FAMILY S1.
SIMILARITY: Contains 1 Kringle domain.

"The murine urckinase-type plasminogen activator gene.";

"The murine urckinase-type plasminogen activator gene.";

Biochemistry 25:8270-8279(1987).

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

-!- GATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

-!- SUBDUNT: FOUND IN HIGH AND LOW MOLECULAR MASS FORMS. EACH CONSISTS OF TWO CHAINS, A AND B. THE HIGH MOLECULAR MASS FORM CONTAINS A LONG CHAIN A. CLEAVAGE OCCURS AFTER RESIDUE 156 IN THE LOW MOLECULAR MASS FORM TO YIELD A SHORT AI CHAIN (BY SIMILARITY).

-!- SIMILARITY: Contains 1 Kringle domain.

-!- SIMILARITY: Contains 1 EGF-like domain.

PIN: THE SINGLE CHAIN ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ACG-308 CATALYZED BY PLASHIN, TISSUE KALLIKKEIN OR FACTOR XA.

MISCELLANEOUS: BINDS TO THE KINGLE STRUCTURE OF THE FIBRIN A CHAIN. BINDING TO FIBRIN ENHANCES ITS CATALYTIC ACTIVITY.

SIMILARITY: CELONIS TO PEPTIDASE FAMILY SI.

SIMILARITY: CONTAINS I EGF-TIKE domain.

SIMILARITY: Contains I fibronectin type I domain.

SIMILARITY: Contains 2 kringle domains.

Schnerch A., Schein J.E., Jones S.J.M., Marra M.A.;
"Generation and initial analysis of more than 15,000 full-length human and mouse cDNA sequences.";
Proc. Natl. Acad. Sci. U.S., 99:16899-16903 (2002).
-!- FUNCTION: CONVERTS THE ABUNDANT, BUT INACTIVE, ZYMOGEN PLASMINOGEN TO PLASMIN BY HYPROLYZING A SINGLE RAG-VL BOND IN PLASMINOCEN. BY CONTROLLING PLASMIN-MEDIATED PROTECLYSIS, IT PLAYS AN IMPORTANT ROLE IN TISSUE REMODELING AND DEGRADATION, IN CELL MIGRATION AND MANY OTHER PHYSIOPRAPHOLOGICAL EVENTS.
-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
-!- SIBMINIT: HETERODIMER OF CHAIN A AND CHAIN B HELD BY A DISULFIDE
                                                                                                                                              BUBCELLULAR LOCATION: SECRETED; EXTRACELLULAR.

FUND: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARC-308 CATALYZED BY PLASMIN, TISSUE KALLIKREIN OR FACTOR XA.

MISCELLANEGUS: BINDS TO THE KRINGLE STRUCTURE OF THE FIBRIN A SIMILARITY: DELONGS TO PERTINASE FAMILY SI.

SIMILARITY: CONTAINS I EGR-11ke domain.

SIMILARITY: Contains 1 fibronectin type I domain.

SIMILARITY: Contains 2 kringle domains.
                                                                                                                                                                                                                                                                                                                                                                     m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PLASMINOGEN ACTIVATOR.

Dairy J. S:605-617(1995).

-!- FUNCTION: CONVERTS THE ABUNDANT, BUT INACTIVE, ZYMOGEN PLASMINOGEN

-!- FUNCTION: CONVERTS THE ABUNDANT, BUT INACTIVE, ZYMOGEN PLASMINOGEN

TO PLASMIN BY HYDROLYZING A SINGLE ARG-VAL BOND IN PLASMINOGEN. BY
CONTROLLING PLASMIN-MEDIATED PROTECLYSIS, IT PLAYS AN IMPORTANT

ROLE IN TISSUE REMODELING AND DEGRADATION, IN CELL MIGRATION AND
MANY OTHER PHYSIOPATHOLOGICAL EVENTS.

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in
plasminogen to form plasmin.

-!- SUBUNIT: HETERODIMER OF CHAIN A AND CHAIN B HELD BY A DISULFIDE
                                                                                                                                                                                                                                                                                                     Ravn P., Berglund L., Petersen T.E.;

PULI ACTIVE ENZYME, CAN BE FURTHER

RECESSED INTO.

A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER

ARG-314 CATALYZED BY PLASHIN, TISSUE KALLIKREIN OR FACTOR XA.

MISCELLANEOUS BINDS TO THE KRINGLE STRUCTURE OF THE FIBRIN A

SIMILARITY: BELONGS TO PEPTIONSE FAMILY S1.

SIMILARITY: COntains I EGF-like domain.

SIMILARITY: Contains I fibronectin type I domain.

SIMILARITY: Contains 2 kringle domains.

                                                                                                                                                                                                                                                                                                                                                    ò
The sector XII Tenri, a novel cross-reacting material negative factor XII

deficiency, occurs through a proteasome-mediated degradation.";

Blood 93:4300-4308(1999)

The Stato-4300-4308(1999)

THE INITIATION OF BLOOD COAGULATION, FIBRINOLYSIS, AND THE CHARATION OF BRADYKININ AND ANGIOTENNIN.

CHARALYTIC ACTIVITY: Cleaves selectively Actor Xia.

VII to form factor VIIa and factor XI to form factor XIa.

CHARALYTIC ACTIVITY: CLEAVES Selectively Actor Xia.

CHARALYTERS IN F12 DO NOT CAUSE ANY CLINICAL SYMPTOMS. THE SOLE EFFECT IS THAT WHOLE-BLOOD CLOTTING TIME IS PROLINGED.

CHOPPIES BOUND TO AN ANIONIC SURFACE. PREMALIKERIN IS CLEAVED BY FACTOR XII TO FORM KALLIKERIN, WHICH THEN CLEAVES FACTOR XII FIRST TO ALPHA-FACTOR XIIA. AND THEN TO BETA-FACTOR XIIA. ALPHA-FACTOR XIA.

CHARALYTY: CONTAINS I GIDEODECTIN TYPE II domain.

CHARALYTY: Contains I fibronectin type II domain.

CHARALYTY: Contains I Kingle domain.
                                                                                                                                                                   This SWISS-PROT entry is copyright.                            ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN
ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
BERIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.
PTW: N-LINKED GLYCAN CONTAINS N-ACETYLLACTOSAVINE, SIALIC ACID AND
IS CORE FUCOSYLATED. O-LINKED GLYCANS CONSIST OF GAL-GALNAC
DISACCHARIDE WITH IS MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES
MICCOLETEROGENEITY).
MICCOLETEROGENEITY).
MICCOLLANGOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIRBIN. ACTIVATED WITH CATALYTIC AMOUNTS OF STREPTOKINASE.
-!- MISCELLANBOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.
-!- MISCELLANBOUS: IN THE PRESENCE OF THE INHIBITOR, THE ACTIVATION
INVOLVES ONLY CLEAVAGE AFTER ARG-580, RESULTING IN 2 CHAINS HELD
TOGETHER BY 2 DISULFIDE BONDS. WITHOUT THE INHIBITOR, THE
ACTIVATION INVOLVES ALSO REMOVAL OF THE ACTIVATION PEPTIDE.
-!- SIMILARITY: COLCAINS 5 Kringle domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          JUBICAL CHEM. 264:5957-5965(1989).

-1. FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING BRERYOMIC DEVELORMENT. TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAAFIAN FOLLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGERASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND CO. II CLEAVES FIBRIN, FIBRONECTIN, THROMEOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.

-1. CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-xaa > Arg-|-xaa; higher selectivity than trypsin. Converts fibrin into soluble

ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIBRIN. ACTIVATED WITH UROKINASE AND HIGH CONCENTRATIONS OF
STREPTOKINASE.
-!- MISCELLANDOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
IMPRIPATELY AFFER DISSOCIATION FROM THE CLOT.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY:
-!- SIMILARITY: Contains at least 1 kringle domain.

-i. FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS A PROTECLYTIC FACTOR IN A VARIETY OF COTHER PROCESSES INCLUDING REMANATION: IN OVULATION IT WEAKENS THE WALLS OF THE GRAAFTAN FOLLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASNINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND CS. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.
                                                                                                                                                                                                                              Ovis aries (Sheep).

                                                                                                                                                                   ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN
CATIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIERIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

PTM: N-LINKED GLYCAN CONTAIN N-ACETYLLACTOSAMINE AND SIALIC ACID.
C-LINKED GLYCAN CONSIST OF GAL-CARNAC DISACCHARIDE WITH IS
MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES (MICROHETEROGENEITY).
MISCELLANGOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.
SIMILARITY: CONTAINS 5 KTINGJE domains.
    GRAAFIAN FOLLICLE. IT ACTIVATES THE UROXINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND CS. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.
CATANYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa; higher selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Interpro; IPR00366; Pan app.

                                                                                                                                                                                                                                                                                                                                                                                                                                                            DISEASE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with exherosclerosis. Homology with plasminogen kringles IV and V is thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin(ogen) binding. MISCELLANEOUS. Apo(a) is known to be proteolytically cleaved, leading to the formation of the so called mini-Lp(a). Apo(a) fragments accumulate in atherosclerotic lesions, where they may promote thrombogenesis. O-glycosylation may limit the extent of
                                                                                                                                                                                                                                                                                                                                                                        PTM: N- and O-glycosylated. The N-glycans are complex biantennary structures present in either a mono- or distalylated state. The O-glycans are mostly (80%) represented by the monosialylated core type I structure, NeuMacalpha2-3Galbeta1-3GalNAc, with smaller amounts of disialylated and non-sialylated O-glycans also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     proteolytic fragmentation.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY
SIMILARITY: Contains 38 kringle domains.

1. Chem. 264:5957-5965(1989).

2. Bidl. Chem.

2. FUNCTION: Apo(a) is the main constituent of lipoprotein(a) (Lp(a)). It has serine proteinses activity and is able of autoproteolysis. Inhibite tissue-type plasminogen activator 1. Lp(a) may be a ligand for megalin/Gp 330.

2. SUBLUNIT: Disublidel-linked to apo-B100. Binds to fibronectin and decorin (By similarity).

3. PTM: N- and 0-glycosylated (By similarity).

3. DISEASE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with atherosclerosis. Homology with plasminogen kringles IV and V is thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin (ogen) binding.

4. Hought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin (ogen) binding.

4. Hought to the formation of the so called mini-Lp(a). Apo(a) fragments are competing with plasminosis, where they may promote thrombogenesis. O-glycosylation may limit the extent of proteolytic fragmentation (By similarity).

5. SIMILARITY: BOLDING TO PERTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.

5. SIMILARITY: Contains at least 10 kringle domains.
